

# Neural Networks - intro

## Part 1 - XOR

1. Using the XOR dataset below, train (400 epochs) a neural network (NN) using 1, 2, 3, 4, and 5 hidden layers (where each layer has only 2 neurons). For each n layers, store the resulting loss score along with n. Plot the results to find what the optimal number of layers is.
2. Repeat the above with 3 neurons in each Hidden layers. How do these results compare to the 2 neuron layers?
3. Repeat the above with 4 neurons in each Hidden layers. How do these results compare to the 2 and 3 neuron layers?
4. Using the most optimal configuraion (n-layers, k-neurons per layer), compare how `tanh` , `sigmoid` , `softplus` and `relu` effect the loss after 400 epochs. Try other Activation functions as well (<https://keras.io/activations/>)
5. Again with the most optimal setup, try other optimizers (instead of `SGD` ) and report on the loss score. (<https://keras.io/optimizers/>)

## Part 2 - BYOD (Bring your own Dataset)

Using your own dataset, experiment and find the best Neural Network configuration. You may use any resource to improve results, just reference it.

While you may use any dataset, I'd prefer you didn't use the diabetes dataset used in the lesson.

```

Based on the results above, the optimal model for the XOR dataset is 1 layer of 3 nodes with a tanh activation and a Nadam optimizer. After multiple runs, the adamax and ftrl optimizer continued to throw errors, so I omitted them from the analysis.

## Part 2 - BYOD (Bring your own Dataset)

Using your own dataset, experiment and find the best Neural Network configuration. You may use any resource to improve results, just reference it.

144 rows x 6 columns

Based on the above results of a for loop over samples of layer, node, activation, and optimizer combinations, a a layer, 3 node NN with a tanh activation and Adam optimizer has the best lost score, followed closely by a 3 layer, 4 node NN with a sigmoid activation and either a RMSprop optimizer.
